

Authorship HEP

GOAL

- improve pre-filtering OAX authors compared with author entity

CONTEXT

- the code is currently missing matches unnecessarily
 - use duckdb and parquet
 - persist expensive sql queries for reuse
 - SQL to do some of this is copied into SQL.md. the parquets already exist
1. filter OAX authorship entity to pull out works_intermediate_hep - works with at least one author at a hep.
 2. join works_intermediate to work + topics entities for publication_year, source_id, topics
 3. join works_intermediate to authorships to get authorships_hep as authorships with work from hep
 4. pick up orcids, display_name_alternatives from authors
 5. groupby authors on authorships_hep join works_hep to get properties of all authors of papers that have a hep relationship
 6. continue with the current pipeline using this new table once it is prepared for splink

CONSTRAINTS

- end point is an author_hep parquet that can be fed into current process with minimal change
