

Authorship HEP

GOAL

- improve approach to pre-filtering OAX authors compared with using the author entity

CONTEXT

- current missing matches including many non-matches. new approach.
1. filter OAX authorship entity to pull out authorships_hep. works with at least one author at a hep. all coauthors have a hep link
 2. join to work entity on work_idx picking up publication_year, source_id, topics
 3. construct authors_hep that can groupby on author_idx or author_name and include coauthors, topics from works, sources, publication_year range
 4. can join on OAX authors entity to pick up oricds
- use duckdb and parquet
 - persist expensive sql queries for reuse

CONSTRAINTS

- end point is an author_hep parquet that can be fed into current process with minimal change
